Device and Device SDK Working Group
Notes for December 2 2019

Status updates

- Go SDK

  - Attribution.txt updates are in

  - PR#383 approved

  - Release notes to be updated and the 1.1.1 version tagged

  - New versions of Go DSs to follow

- device-bluetooth-c

  - AppArmor configuration has been written to allow operation without full privs

  - Need to consider mechanisms for non-AppArmor distributions eg Fedora

Discovery

- https://github.com/edgexfoundry/device-sdk-c/issues/212

- Should clarify the whitelist/blacklist nature of the matching identifiers

- Should make the "new devices" mechanism available to the protocol driver at any time, not just as a response to discovery – this allows for devices which self-announce to be added immediately

- DSs should document whether they implement discovery and if so what limitations or special requirements apply

- Discovery REST endpoint should return a not-implemented indication if appropriate

- Consider a new endpoint which would list a DSs capabilities, of which discovery would be one
