Core Working Group Agenda (20-Jun-2019)

Attendees:

Old Business

- Plug in alternatives
    - Check in with Lenny RE: Hashicorp plugins
    - Provided examples are simple, actual usage a bit more complicated
    - Choice of RPC / GRPC
- Value Descriptor mgmt.
    - Follow-up thought → I think we could reasonably remove the creation of Value Descriptors from the Device SDK and move that logic into core-metadata without a versioning impact.
    - The operational logic is changing but nothing about the API signature is changing.
    - If agreement, then I will create issues in device-sdk and core-metadata

New Business

- Device Provisioning continued
    - Use case of re-provisioning a moving device from one device service to another.
        - For example, a wearable device on a person moving from one building to the next
    - https://github.com/edgexfoundry/edgex-go/issues/1451
- Driving configuration via Environment (Michael Estrin)
- Go.sum checkins
    - I think the opinion toward committing this is positive
    - If so, based on DevOps call, we might need to add "go mod update" to the Makefile to ensure latest deps are always pulled in – locally and build pipeline.
