

Kamakura Release

Delivery: ~ May 2022

Namer: Tony Espy (Canonical)

The Kamakura release is anticipated to be a dot release that is backward compatible with all EdgeX 2.x releases. The release is not anticipated to be an LTS release.

Major additions planned for this release include:

- Improved security secrets seeding and allowing for delayed service starts
- Initial North to south message bus
- Metrics collection
- Dynamic device profiles (changes to device profiles)
- Better (native) Windows support
- Improve testing (including first real hardware testing)
- V2 of the CLI

The slide deck below provides detailed scope and action items for the release (from the November 2021 planning meeting)
